16-CHANNEL CONSTANT-CURRENT LED SINK DRIVERS

FEATURES

- 16 Constant-Current Output Channels
- Output Current Adjusted By External Resistor
- Constant Output Current Range: 5 mA to 120 mA
- Constant Output Current Invariant to Load Voltage Change
- Open-Load, Shorted-Load and Overtemperature Detection
- 256-Step Programmable Global Current Gain
- Excellent Output-Current Accuracy:
 - Between Channels: < $\pm 6\%$ (Max), 10 mA to 50 mA
 - Between ICs: < $\pm 6\%$ (Max), 10 mA to 50 mA
- 30-MHz Clock Frequency
- Schmitt-Trigger Input
- 3.3-V or 5-V Supply Voltage
- Thermal Shutdown for Overtemperature Protection
- ESD Performance: 2-kV HBM

APPLICATIONS

- General LED Lighting Applications
- LED Display Systems
- LED Signage
- Automotive LED Lighting
- White Goods

DESCRIPTION/ORDERING INFORMATION

The TLC5926/TLC5927 is designed for LED displays and LED lighting applications with open-load, shorted-load, and overtemperature detection, and constant-current control. The TLC5926/TLC5927 contains a 16-bit shift register and data latches, which convert serial input data into parallel output format. At the TLC5926/TLC5927 output stage, 16 regulated-current ports provide uniform and constant current for driving LEDs within a wide range of V_F (Forward Voltage) variations. Used in systems designed for LED display applications (e.g., LED panels), TLC5926/TLC5927 provides great flexibility and device performance. Users can adjust the output current from 5 mA to 120 mA through an external resistor, R_{ext} , which gives flexibility in controlling the light intensity of LEDs. TLC5926/TLC5927 is designed for up to 17 V at the output port. The high clock frequency, 30 MHz, also satisfies the system requirements of high-volume data transmission.

The TLC5926/TLC5927 provides a Special Mode in which two functions are included, Error Detection and Current Gain Control. In the TLC5926/TLC5927 there are two operation modes and three phases: Normal Mode phase, Mode Switching transition phase, and Special mode phase. The signal on the multiple-function pin \overline{OE} (ED2) is monitored, and when an one-clock-wide short pulse appears on \overline{OE} (ED2), TLC5926/TLC5927 enters the Mode Switching phase. At this time, the voltage level on LE(ED1) determines the next mode into which the TLC5926/TLC5927 switches.

In the Normal Mode phase, the serial data is transferred into TLC5926/TLC5927 via SDI, shifted in the shift register, and transferred out via SDO. LE(ED1) can latch the serial data in the shift register to the output latch. \overline{OE} (ED2) enables the output drivers to sink current.

In the Special Mode phase, the low-voltage-level signal \overline{OE} (ED2) can enable output channels and detect the status of the output current, to tell if the driving current level is enough or not. The detected error status is loaded into the 16-bit shift register and shifted out via SDO, along with the CLK signal. The system controller can read the error status to determine whether or not the LEDs are properly lit. In the Special Mode phase, TLC5926/TLC5927 also allows users to adjust the output current level by setting a runtime-programmable Configuration Code. The code is sent into TLC5926/TLC5927 via SDI. The positive pulse of LE(ED1) latches the code in the shift register into a built-in 8-bit configuration latch, instead of the output latch. The code affects the voltage at R-EXT and controls the output-current regulator. The output current can be adjusted finely by a gain ranging from 1/12 to 127/128 in 256 steps. Therefore, the current skew between ICs can be compensated within less than 1%, and this feature is suitable for white balancing in LED color-display panels.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

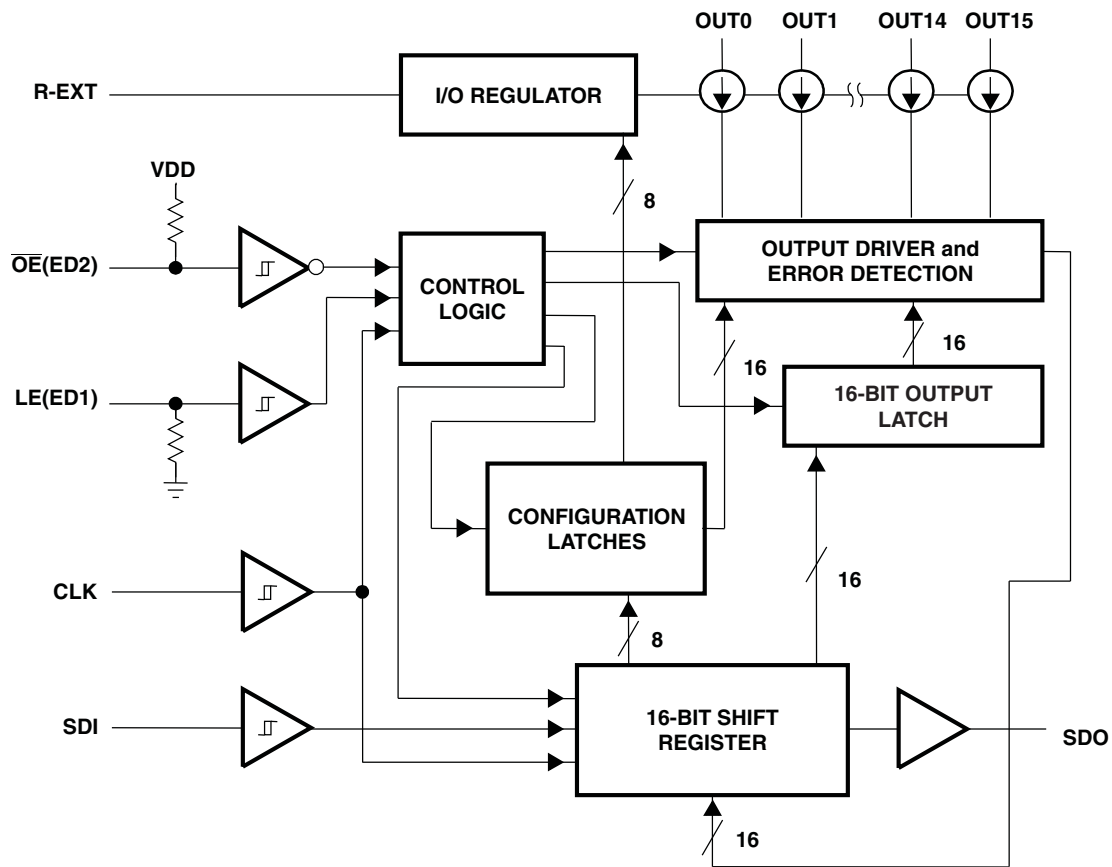

PowerPAD is a trademark of Texas Instruments.

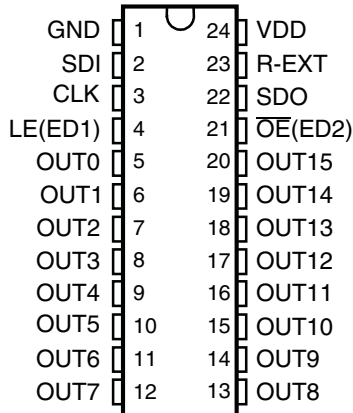

ORDERING INFORMATION⁽¹⁾

T _A	PACKAGE ⁽²⁾		ORDERABLE PART NUMBER	TOP-SIDE MARKING
-40°C to 85°C	PowerPAD™ – PWP	Reel of 2000	TLC5926IPWPR	Y5926
			TLC5927IPWPR	Y5927
	W-SOIC – DW	Reel of 2000	TLC5926IDWR	TLC5926I
			TLC5927IDWR	TLC5927I
	SSOP – DBQ	Reel of 2000	TLC5926IDBQR	TLC5926I
			TLC5927IDBQR	TLC5927I

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

BLOCK DIAGRAM

**DBQ, DW, OR PWP PACKAGE
(TOP VIEW)**

Pin Descriptions

PIN NAME	DESCRIPTION
CLK	Clock input pin for data shift on rising edge
GND	Ground pin for control logic and current sink
LE(ED1)	Data strobe input pin Serial data is transferred to the respective latch when LE(ED1) is high. The data is latched when LE(ED1) goes low. Also, a control signal input for an Error Detection mode and Current Adjust mode (See Timing Diagram). LE(ED1) has an internal pulldown.
\overline{OE} (ED2)	Output enable pin. When \overline{OE} (ED2)(active) is low, the output drivers are enabled; when \overline{OE} (ED2) is high, all output drivers are turned OFF (blanked). Also, a control signal input for an Error Detection mode and Current Adjust mode (See Timing Diagram). \overline{OE} (ED2) has an internal pull-up.
OUT0–OUT15	Constant-current output pins
R-EXT	Input pin used to connect an external resistor for setting up all output currents
SDI	Serial-data input to the Shift register
SDO	Serial-data output to the following SDI of next driver IC or to the microcontroller
VDD	Supply voltage pin

Diagnostic Features

DEVICE ⁽¹⁾	OPEN-LOAD DETECTION	SHORT TO GND DETECTION	SHORT TO V_{LED} DETECTION
TLC5926	x	x	
TLC5927	x	x	x

(1) The device has one single error register for all these conditions (one error bit per channel)

Timing Diagrams

Figure 1. Normal Mode

Truth Table in Normal Mode

CLK	LE(ED1)	$\overline{OE}(ED2)$	SDI	OUT0...OUT15	SDO
↑	H	L	Dn	Dn...Dn - 7...Dn - 15	Dn - 15
↑	L	L	Dn + 1	No change	Dn - 14
↑	H	L	Dn + 2	Dn + 2...Dn - 5...Dn - 13	Dn - 13
↓	X	L	Dn + 3	Dn + 2...Dn - 5...Dn - 13	Dn - 13
↓	X	H	Dn + 3	off	Dn - 13

The signal sequence shown in Figure 2 makes the TLC5926/TLC5927 enter Current Adjust and Error Detection mode.

Figure 2. Switching to Special Mode

In the Current Adjust mode, sending the positive pulse of LE(ED1), the content of the shift register (a current adjust code) is written to the 16-bit configuration latch (see Figure 3).

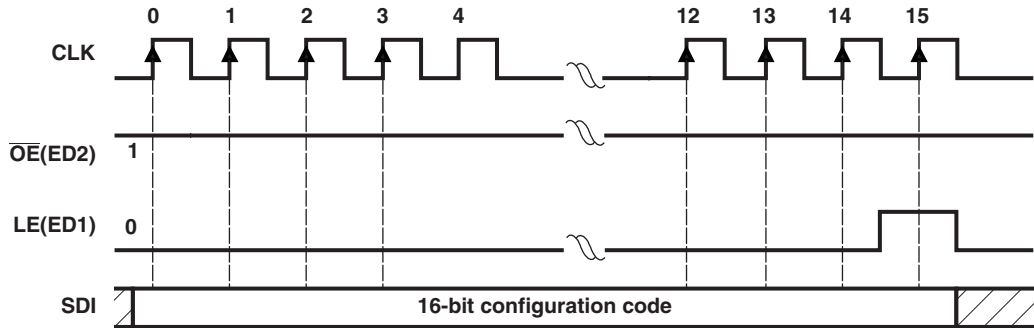

Figure 3. Writing Configuration Code

When the TLC5926/TLC5927 is in the error detection mode, the signal sequence shown in Figure 4 enables a system controller to read error status codes through SDO.

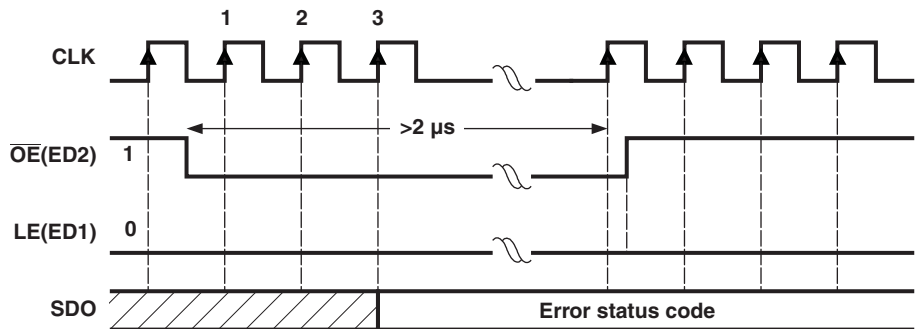

Figure 4. Reading Error Status Code

The signal sequence shown in Figure 5 makes TLC5926/TLC5927 resume the Normal mode. Switching to Normal mode resets all internal Error Status registers. OE (ED2) always enables the output port, whether the TLC5926/TLC5927 enters current adjust mode or not.

Figure 5. Switching to Normal Mode

Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V_{DD}	Supply voltage	0	7	V
V_I	Input voltage	-0.4	$V_{DD} + 0.4$	V
V_O	Output voltage	-0.5	20	V
I_{OUT}	Output current		120	mA
I_{GND}	GND terminal current		1920	mA
T_A	Free-air operating temperature range	-40	85	°C
T_J	Operating junction temperature range	-40	150	°C
T_{stg}	Storage temperature range	-55	150	°C
ESD	Electrostatic-Discharge Capability $V_{(HBMESD)}$ (100 pF, 1.5 k Ω)		2	kV

Power Dissipation and Thermal Impedance

			MIN	MAX	UNIT
P_D	Power dissipation	Mounted on JEDEC 4-layer board (JESD 51-7), No airflow, $T_A = 25^\circ\text{C}$, $T_J = 125^\circ\text{C}$	DBQ package	1.6	W
			DW package	2.2	
			PWP package	2.3	
		Mounted on JEDEC 4-layer board (JESD 51-5), No airflow, $T_A = 25^\circ\text{C}$, $T_J = 125^\circ\text{C}$	PWP package	2.9	
θ_{JA}	Thermal impedance, junction to free air	Mounted on JEDEC 1-layer board (JESD 51-3), No airflow	DBQ package	99.8	°C/W
			DW package	80.5	
			PWP package	63.9	
		Mounted on JEDEC 4-layer board (JESD 51-7), No airflow	DBQ package	61.0	
			DW package	45.5	
			PWP package	42.7	
		Mounted on JEDEC 4-layer board (JESD 51-5), No airflow	PWP package	34.5	
θ_{JP}	Thermal impedance, junction to pad	PWP package	2.0	°C/W	

Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		TEST CONDITIONS		MIN	MAX	UNIT
V_{DD}	Supply voltage			3	5.5	V
V_O	Supply voltage to the output pins	OUT0–OUT15			17	V
I_O	Output current	DC test circuit	$V_O \geq 0.6\text{ V}$	5	120	mA
			$V_O \geq 1\text{ V}$			
I_{OH}	High-level output current	SDO			-1	mA
I_{OL}	Low-level output current	SDO			1	mA
V_{IH}	High-level input voltage	CLK, \overline{OE} (ED2), LE(ED1), and SDI		$0.7 \times V_{DD}$	V_{DD}	V
V_{IL}	Low-level input voltage	CLK, \overline{OE} (ED2), LE(ED1), and SDI		0	$0.3 \times V_{DD}$	V

Recommended Timing

 $V_{DD} = 3\text{ V to }5.5\text{ V}$ (unless otherwise noted)

		TEST CONDITIONS	MIN	MAX	UNIT
$t_{w(L)}$	LE(ED1) pulse duration	Normal mode	20		ns
$t_{w(CLK)}$	CLK pulse duration	Normal mode	20		ns
$t_{w(OE)}$	\overline{OE} (ED2) pulse duration	Normal mode	1000		ns
$t_{su(D)}$	Setup time for SDI	Normal mode	7		ns
$t_{h(D)}$	Hold time for SDI	Normal mode	3		ns
$t_{su(L)}$	Setup time for LE(ED1)	Normal mode	18		ns
$t_{h(L)}$	Hold time for LE(ED1)	Normal mode	18		ns
$t_{w(CLK)}$	CLK pulse duration	Error Detection mode	20		ns
$t_{w(ED2)}$	\overline{OE} (ED2) pulse duration	Error Detection mode	2000		ns
$t_{su(ED1)}$	Setup time for LE(ED1)	Error Detection mode	7		ns
$t_{h(ED1)}$	Hold time for LE(ED1)	Error Detection mode	10		ns
$t_{su(ED2)}$	Setup time for \overline{OE} (ED2)	Error Detection mode	7		ns
$t_{h(ED2)}$	Hold time for \overline{OE} (ED2)	Error Detection mode	10		ns
f_{CLK}	Clock frequency	Cascade operation, $V_{DD} = 3\text{ V to }5.5\text{ V}$		30	MHz

Electrical Characteristics

$V_{DD} = 3\text{ V}$, $T_J = -40^\circ\text{C}$ to 125°C (unless otherwise noted)

Operating Principles

Constant Current

In LED display applications, TLC5926/TLC5927 provides nearly no current variations from channel to channel and from IC to IC. While $I_{OUT} \leq 50$ mA, the maximum current skew between channels is less than $\pm 6\%$ and between ICs is less than $\pm 6\%$.

Adjusting Output Current

TLC5926/TLC5927 scales up the reference current, I_{ref} , set by the external resistor R_{ext} to sink a current, I_{out} , at each output port. Users can follow the below formulas to calculate the target output current $I_{OUT,target}$ in the saturation region:

$$V_{R-EXT} = 1.26 \text{ V} \times VG$$

$I_{ref} = V_{R-EXT}/R_{ext}$, if another end of the external resistor R_{ext} is connected to ground.

$$I_{OUT,target} = I_{ref} \times 15 \times 3^{CM - 1}$$

Where R_{ext} is the resistance of the external resistor connected to the R-EXT terminal, and V_{R-EXT} is the voltage of R-EXT, which is controlled by the programmable voltage gain (VG), which is defined by the Configuration Code. The Current Multiplier (CM) determines that the ratio $I_{OUT,target}/I_{ref}$ is 15 or 5. After power on, the default value of VG is $127/128 = 0.992$, and the default value of CM is 1, so that the ratio $I_{OUT,target}/I_{ref} = 15$. Based on the default VG and CM.

$$V_{R-EXT} = 1.26 \text{ V} \times 127/128 = 1.25 \text{ V}$$

$$I_{OUT,target} = (1.25 \text{ V}/R_{ext}) \times 15$$

Therefore, the default current is approximately 52 mA at 360 Ω and 26 mA at 720 Ω . The default relationship after power on between $I_{OUT,target}$ and R_{ext} is shown in Figure 11.

Figure 11. Default Relationship Curve Between $I_{OUT,target}$ and R_{ext}

Operation Phases

Operation Mode Switching

In order to switch between its two modes, TLC5926/TLC5927 monitors the signal $\overline{OE}(ED2)$. When a one-clock-wide pulse of $\overline{OE}(ED2)$ appears, TLC5926/TLC5927 enters the two-clock-period transition phase, the Mode Switching phase. After power on, the default operation mode is the Normal Mode (see Figure 12).

Figure 12. Mode Switching

As shown in Figure 12, once a one-clock-wide short pulse (101) of $\overline{OE}(ED2)$ appears, TLC5926/TLC5927 enters the Mode Switching phase. At the fourth rising edge of CLK, if LE(ED1) is sampled as voltage high, TLC5926/TLC5927 switches to Special mode; otherwise, it switches to Normal mode. The signal LE(ED1) between the third and the fifth rising edges of CLK cannot latch any data. Its level is used only to determine into which mode to switch. However, the short pulse of $\overline{OE}(ED2)$ can still enable the output ports. During mode switching, the serial data can still be transferred through SDI and shifted out from SDO.

NOTES:

1. The signal sequence for the mode switching may be used frequently to ensure that the TLC5926/TLC5927 is in the proper mode.
2. The 1 and 0 on the LE(ED1) signal are sampled at the rising edge of CLK. The X means its level does not affect the result of mode switching mechanism.
3. After power on, the default operation mode is Normal mode.

Normal Mode Phase

Serial data is transferred into TLC5926/TLC5927 via SDI, shifted in the Shift Register, and output via SDO. LE(ED1) can latch the serial data in the Shift Register to the Output Latch. $\overline{OE}(ED2)$ enables the output drivers to sink current. These functions differ only as described in Operation Mode Switching, in which case, a short pulse triggers TLC5926/TLC5927 to switch the operation mode. However, as long as LE(ED1) is high in the Mode Switching phase, TLC5926/TLC5927 remains in the Normal mode, as if no mode switching occurred.

Special Mode Phase

In the Special mode, as long as $\overline{OE}(ED2)$ is not low, the serial data is shifted to the Shift Register via SDI and shifted out via SDO, as in the Normal mode. However, there are two differences between the Special Mode and the Normal Mode, as shown in the following sections.

Reading Error Status Code in Special Mode

When $\overline{OE}(ED2)$ is pulled low while in Special mode, error detection and load error status codes are loaded into the Shift Register, in addition to enabling output ports to sink current. Figure 13 shows the timing sequence for error detection. The 0 and 1 signal levels are sampled at the rising edge of each CLK. At least three zeros must be sampled at the voltage low signal $\overline{OE}(ED2)$. Immediately after the second 0 is sampled, the data input source of the Shift Register changes to the 16-bit parallel Error Status Code register, instead of from the serial data on SDI. Normally, the error status codes are generated at least 2 μ s after the falling edge of $\overline{OE}(ED2)$. The occurrence of the third or later 0 saves the detected error status codes into the Shift Register. Therefore, when $\overline{OE}(ED2)$ is low, the serial data cannot be shifted into TLC5926/TLC5927 via SDI. When $\overline{OE}(ED2)$ is pulled high, the data input source of the Shift Register is changed back to SDI. At the same time, the output ports are disabled and the error detection is completed. Then, the error status codes saved in the Shift Register can be shifted out via SDO bit-by-bit along with CLK, as well as the new serial data can be shifted into TLC5926/TLC5927 via SDI.

While in Special mode, the TLC5926/TLC5927 cannot simultaneously transfer serial data and detect LED load error status.

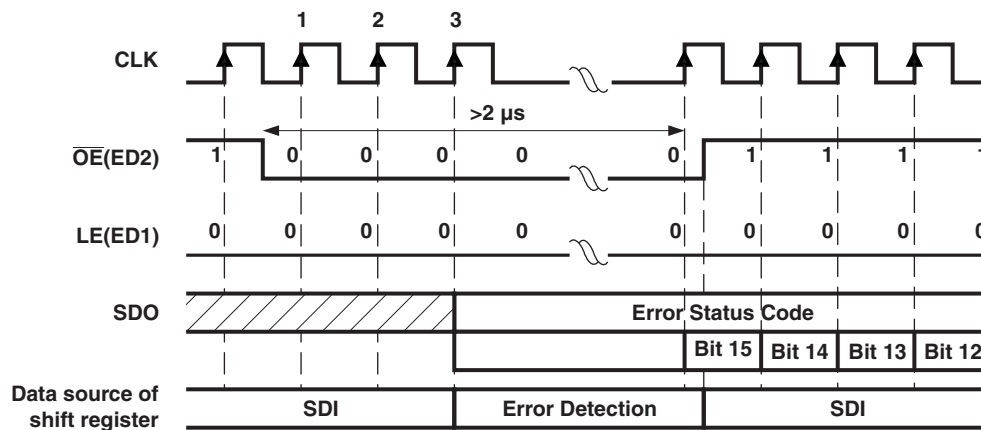

Figure 13. Reading Error Status Code

Writing Configuration Code in Special Mode

When in Special mode, the active high signal LE(ED1) latches the serial data in the Shift Register to the Configuration Latch, instead of the Output Latch. The latched serial data is used as the Configuration Code.

The code is stored until power off or the Configuration Latch is rewritten. As shown in Figure 14, the timing for writing the Configuration Code is the same as the timing in the Normal Mode to latching output channel data. Both the Configuration Code and Error Status Code are transferred in the common 16-bit Shift Register. Users must pay attention to the sequence of error detection and current adjustment to avoid the Configuration Code being overwritten by Error Status Code.

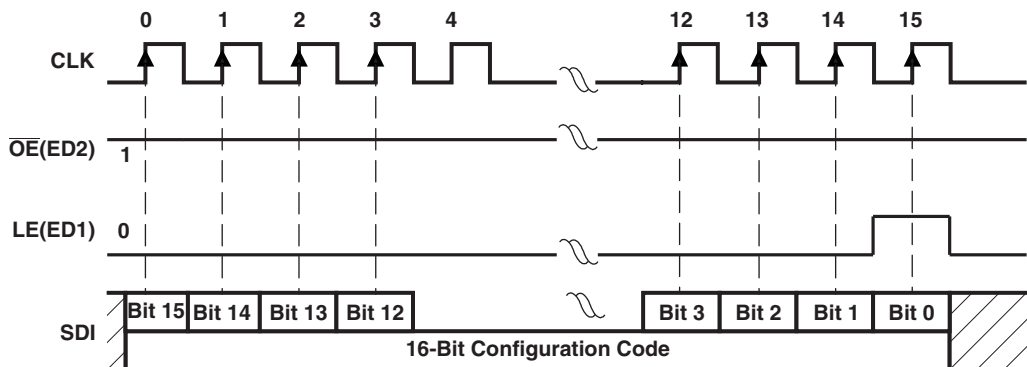

Figure 14. Writing Configuration Code

Open-Circuit Detection Principle

The LED Open-Circuit Detection compares the effective current level I_{OUT} with the open load detection threshold current $I_{OUT,Th}$. If I_{OUT} is below the $I_{OUT,Th}$ threshold, the TLC5926/TLC5927 detects an open-load condition. This error status can be read as an error status code in the Special mode. For open-circuit error detection, a channel must be on.

Table 1. Open-Circuit Detection

STATE OF OUTPUT PORT	CONDITION OF OUTPUT CURRENT	ERROR STATUS CODE	MEANING
Off	$I_{OUT} = 0 \text{ mA}$	0	Detection not possible
On	$I_{OUT} < I_{OUT,Th}^{(1)}$	0	Open circuit
	$I_{OUT} \geq I_{OUT,Th}^{(1)}$	Channel n error status bit 1	Normal

(1) $I_{OUT,Th} = 0.5 \times I_{OUT,target}$ (typical)

Short-Circuit Detection Principle (TLC5927 Only)

The LED short-circuit detection compares the effective voltage level V_{OUT} with the shorted-load detection threshold voltages $V_{OUT,TTh}$ and $V_{OUT,RTh}$. If V_{OUT} is above the $V_{OUT,TTh}$ threshold, the TLC5927 detects an shorted-load condition. If the V_{OUT} is below $V_{OUT,RTh}$ threshold, no error is detected and the error bit is reset. This error status can be read as an error status code in the Special mode. For short-circuit error detection, a channel must be on.

Table 2. Short-Circuit Detection

STATE OF OUTPUT PORT	CONDITION OF OUTPUT VOLTAGE	ERROR STATUS CODE	MEANING
Off	$I_{OUT} = 0 \text{ mA}$	0	Detection not possible
On	$V_{OUT} < V_{OUT,TTh}^{(1)}$	0	Short circuit
	$V_{OUT} < V_{OUT,RTh}^{(1)}$	Channel n error status bit 1	Normal

(1) $I_{OUT,Th} = 0.5 \times I_{OUT,target}$ (typical)

Overtemperature Detection and Shutdown

The TLC5926/TLC5927 is equipped with a global overtemperature sensor and 16 individual, channel-specific overtemperature sensors.

- When the global sensor reaches the trip temperature, all output channels are shutdown, and the error status is stored in the internal Error Status register of every channel. After shutdown, the channels automatically restart after cooling down, if the control signal (output latch) remains on. The stored error status is not reset after cooling down and can be read out as the error status code in the Special mode.
- When one of the channel-specific sensors reaches trip temperature, only the affected output channel is shut down, and the error status is stored only in the internal Error Status register of the affected channel. After shutdown, the channel automatically restarts after cooling down, if the control signal (output latch) remains on. The stored error status is not reset after cooling down and can be read out as error status code in the Special mode.

For channel-specific overtemperature error detection, a channel must be on.

The error status code is reset when the TLC5926/TLC5927 returns to Normal mode.

Table 3. Overtemperature Detection⁽¹⁾

STATE OF OUTPUT PORT	CONDITION	ERROR STATUS CODE	MEANING
Off	$I_{OUT} = 0 \text{ mA}$	0	
On On → all channels Off	$T_j < T_{j,trip} \text{ global}$	1	Normal
	$T_j > T_{j,trip} \text{ global}$	All error status bits = 0	Global overtemperature
On On → Off	$T_j < T_{j,trip} \text{ channel n}$	1	Normal
	$T_j > T_{j,trip} \text{ channel n}$	Channel n error status bit = 0	Channel n overtemperature

(1) The global shutdown threshold temperature is approximately 170°C.

16-Bit Configuration Code and Current Gain

Bit definition of the Configuration Code in the Configuration Latch is shown in [Table 4](#).

Table 4. Bit Definition of 8-Bit Configuration Code

	Bit 0	Bit 1	Bit 2	Bit 3	Bit 4	Bit 5	Bit 6	Bit 7	Bit 8–15
Meaning	CM	HC	CC0	CC1	CC2	CC3	CC4	CC5	Don't care
Default	1	1	1	1	1	1	1	1	X

Bit 7 is first sent into TLC5926/TLC5927 via SDI. Bits 1 to 7 {HC, CC[0:5]} determine the voltage gain (VG) that affects the voltage at R-EXT and indirectly affects the reference current, I_{ref} , flowing through the external resistor at R-EXT. Bit 0 is the Current Multiplier (CM) that determines the ratio $I_{OUT,target}/I_{ref}$. Each combination of VG and CM gives a specific Current Gain (CG).

- VG: the relationship between {HC, CC[0:5]} and the voltage gain is calculated as shown below:

$$VG = (1 + HC) \times (1 + D/64) / 4$$

$$D = CC0 \times 2^5 + CC1 \times 2^4 + CC2 \times 2^3 + CC3 \times 2^2 + CC4 \times 2^1 + CC5 \times 2^0$$

Where HC is 1 or 0, and D is the binary value of CC[0:5]. So, the VG could be regarded as a floating-point number with 1-bit exponent HC and 6-bit mantissa CC[0:5]. {HC, CC[0:5]} divides the programmable voltage gain VG into 128 steps and two sub-bands:

Low voltage sub-band (HC = 0): $VG = 1/4 \sim 127/256$, linearly divided into 64 steps

High voltage sub-band (HC = 1): $VG = 1/2 \sim 127/128$, linearly divided into 64 steps

- CM: In addition to determining the ratio $I_{OUT,target}/I_{ref}$, CM limits the output current range.

High Current Multiplier (CM = 1): $I_{OUT,target}/I_{ref} = 15$, suitable for output current range $I_{OUT} = 10 \text{ mA}$ to 120 mA .

Low Current Multiplier (CM = 0): $I_{OUT,target}/I_{ref} = 5$, suitable for output current range $I_{OUT} = 5 \text{ mA}$ to 40 mA

- CG: The total Current Gain is defined as the following.

$$V_{R-EXT} = 1.26 \text{ V} \times VG$$

$$I_{ref} = V_{R-EXT}/R_{ext}, \text{ if the external resistor, } R_{ext}, \text{ is connected to ground.}$$

$$I_{OUT,target} = I_{ref} \times 15 \times 3^{CM-1} = 1.26 \text{ V}/R_{ext} \times VG \times 15 \times 3^{CM-1} = (1.26 \text{ V}/R_{ext} \times 15) \times CG$$

$$CG = VG \times 3^{CM-1}$$

Therefore, $CG = (1/12)$ to $(127/128)$ divided into 256 steps.

Examples

- Configuration Code {CM, HC, CC[0:5]} = {1,1,111111}
 $VG = 127/128 = 0.992$ and $CG = VG \times 3^0 = VG = 0.992$
- Configuration Code = {1,1,000000}
 $VG = (1 + 1) \times (1 + 0/64)/4 = 1/2 = 0.5$, and $CG = 0.5$
- Configuration Code = {0,0,000000}
 $VG = (1 + 0) \times (1 + 0/64)/4 = 1/4$, and $CG = (1/4) \times 3^{-1} = 1/12$

After power on, the default value of the Configuration Code {CM, HC, CC[0:5]} is {1,1,111111}. Therefore, $VG = CG = 0.992$. The relationship between the Configuration Code and the Current Gain is shown in [Figure 15](#).

Figure 15. Current Gain vs Configuration Code

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

THERMAL PAD MECHANICAL DATA

PWP (R-PDSO-G24) PowerPAD™ SMALL PLASTIC OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
